

NEW SWITCH BACK PLUS

Just add Dante for a headphone mixer + interface

Sneak peek of stand-alone studio-quality mixer + Dante interface + network MIDI control

Hear Technologies is excited to announce the Switch Back PLUS, a Dante-based stand-alone mixer and interface, now open for preorder and scheduled to ship

The Switch Back PLUS provides studio-quality audio and flexibility – just plug into your Dante network, route channels, and you're up and running, no Hub needed. It provides headphone or in-ear mixing PLUS interface options for microphone, instrument, and stereo line inputs. It's an exceptional, flexible tool for live production, recording, worship, and broadcast spaces.

Mix with the PLUS:

With the Switch Back PLUS, simply connect to your Dante network through PoE+ for a full-featured personal monitor mixer. The PLUS provides up to 32 mixable stereo channels combined with 4 local inputs on each device. Connect to Dante, power the device, and stream audio all through a single Ethernet port. And it's scalable: Add as many PLUS mixers as the Dante network and PoE+ switch can accommodate. Name each PLUS and route input channels from Dante Controller. View channel names, device name, status messages, and menus on bright, easily readable OLED displays.

Transmit from the PLUS:

Plugging your equipment into the Switch Back PLUS' studio-quality mic, high-impedance instrument, and balanced stereo line inputs connects you directly to the Dante network. The microphone input provides optional 48-volt phantom power and has been finely tuned with a range of 0dB to 50dB microphone gain. With the press of a button, the user can route the microphone input to other devices to serve as a talkback. The Switch Back PLUS is the ultimate interface for a live concert - it only takes a single Cat 6 cable routed to the stage for personal mixing and low-latency audio returns. The PLUS also outputs its complete stereo left and right mix back to the Dante network on two channels. This makes it simple for a studio recording engineer to monitor what the artists are hearing.

MIDI control with the PLUS:

The Switch Back PLUS can also serve as a MIDI control surface over network-based MIDI. So you can control your DAW or other networked MIDI device with fine-control, grippy physical knobs. And we made the SB PLUS compatible with both MIDI 1.0 and MIDI 2.0 devices.

Preorders for the Switch Back PLUS are currently open. Find Hear Technologies dealers: HearTechnologies.com/Buy.

ABOUT HEAR TECHNOLOGIES

Hear Technologies designs and manufactures pro audio equipment that makes live sound, recording, worship, and home studio environments easier for engineers and musicians. More than two decades of experience paired with our innovative approach to new designs keeps us at the forefront. Our extraordinary-sounding knob-based personal monitoring control systems make individual headphone and in-ear mixing easy.
